Equations and Codes

中国科学院信息工程研究所
INSTITUTE OF INFORMATION ENGINEERING,CAS

Equation Example

Some random equation:

$$\begin{aligned}\frac{\partial}{\partial\theta_k}J(\theta) &= \frac{\partial}{\partial\theta_k}\left[\frac{1}{m}\sum_{k=1}^{m} log(1+e^{-y^{(i)}\theta^T x^{(i)}})\right] \\ &= \frac{1}{m}\sum_{k=1}^{m}\frac{1}{1+e^{-y^{(i)}\theta^T x^{(i)}}}y^{(i)}x_k^{(i)} \\ &= -\frac{1}{m}\sum_{k=1}^{m} h_\theta(-y^{(i)}x^{(i)})y^{(i)}x_k^{(i)}\end{aligned}$$

Code Example #1

```
def softmax_loss_naive(W, X, y, reg):
  """
  Softmax loss function, naive implementation (with loops)

  Inputs have dimension D, there are C classes, and we operate on minibatches
  of N examples.

  Inputs:
  - W: A numpy array of shape (D, C) containing weights.
  - X: A numpy array of shape (N, D) containing a minibatch of data.
  - y: A numpy array of shape (N,) containing training labels; y[i] = c means
    that X[i] has label c, where 0 <= c < C.
  - reg: (float) regularization strength

  Returns a tuple of:
  - loss as single float
  - gradient with respect to weights W; an array of same shape as W
  """
```

Carbon

Code Example #2

```
import numpy as np
```

```
1 def code():
2   # test comments #1
3   if True:
4     for _ in range(5):
5       print("Hello World 5 times")
6   return None
```
